Your four free film looks.

F11-F14 from the GuVue Film Collection. Two versions for each look.

WHAT IS IN YOUR DOWNLOAD

FILE MAP

Choose the folder that matches your footage.

01_AppleLog2 - 4 CUBE files for matching Apple Log 2 footage.
02_Rec709 - 4 CUBE files for matching Rec.709 SDR footage.
Illustrated guide - this PDF and a short README. Files are 33-point CUBE.

YOUR FOUR SAMPLE LOOKS

F11 Kodak 250D Cinema

F12 Kodak Ektar Daylight

F13 Kodak P800 Documentary

F14 Lomo92 Vintage

THE COMPLETE COLLECTION

Want all 14 film looks?

The complete pack includes F01-F14 in Apple Log 2 and Rec.709.

Explore the complete Film Collection >

Each look has one Apple Log 2 file and one Rec.709 file. Film-stock and camera names describe creative color inspiration and do not imply manufacturer affiliation.

Blackmagic Camera on iPhone, pages 3-5. DaVinci Resolve, page 6.

Match the input. Then choose the look.

A file extension or a flat-looking image alone does not identify the footage color space.

PATH A

Apple Log 2 footage

Use the file from **01_AppleLog2**.

These LUTs include the look and a conversion to SDR. Feed them the matching Apple Log 2 signal. Do not put another Log-to-Rec.709 conversion before the same file.

PATH B

Rec.709 SDR footage

Use the file from **02_Rec709**.

Use this version on a matching Rec.709 SDR image. For other camera Log formats, first make an appropriate technical conversion to Rec.709, then apply the Rec.709 look.

A SIMPLE WORKFLOW

01 **Exposure + white balance**

02 **One matching GuVue LUT**

03 **Fine-tune + check export**

IMPORTANT

Apple Log, Apple Log 2, other camera Log, HLG and Dolby Vision are not interchangeable inputs. In a color-managed project, verify what signal reaches the LUT node; automatic conversions can otherwise cause double transforms. Test a short clip before using a setup for a full shoot.

Prepare your iPhone.

Blackmagic Camera / 1 of 3. Extract the download and pick a recording mode.

01 / FILES

Download and unzip the pack.

Open the download link from your order. If the ZIP opens as a preview, tap **Share > Save to Files**. In the Files app, look in **Browse > iCloud Drive** or **On My iPhone**, then open your Downloads folder. Tap the ZIP to extract it. Open the extracted folder and wait for any cloud downloads to finish.

02 / CAMERA

Choose the recording color space.

Open Blackmagic Camera by Blackmagic Design Inc. Grant camera access and microphone access if you want sound. In the app, open **Settings > Record > Color Space** and check which options your phone and recording settings offer.

APPLE LOG 2

01_AppleLog2

If **Apple Log 2 - HDR** is available and you want to shoot in Log, select it and import the files ending in **_AppleLog2.cube**.

REC.709

02_Rec709

For standard SDR recording, choose **Rec.709** and import the files ending in **_Rec709.cube**. Use this route if your phone offers Rec.709 but lacks Apple Log 2.

If your phone offers the original Apple Log but lacks Apple Log 2, choose Rec.709 if available and use the Rec.709 files.

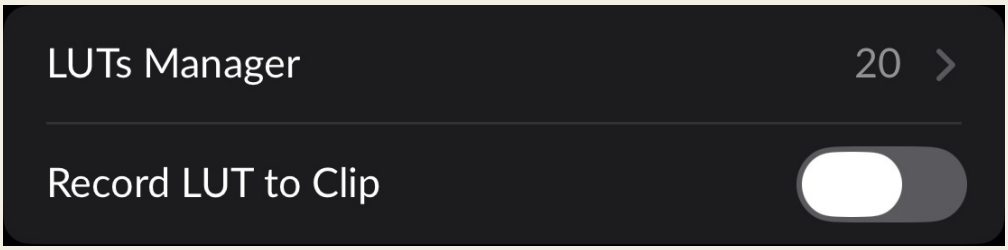

Blackmagic Camera on the App Store

Import your Film LUTs.

Blackmagic Camera / 2 of 3. Start with one look from the folder you selected.

01 Open LUTs Manager

Tap **Settings** in Blackmagic Camera. Scroll to the **LUTs** section and open **LUTs Manager**.

02 Find Import LUT

Scroll to the bottom of LUTs Manager and tap **Import LUT**.

03 Select a .cube file

In the file picker, tap **Browse** to reach the extracted folder on your iPhone or in iCloud Drive. Open **01_AppleLog2** or **02_Rec709** and tap an individual file, such as **GuVue_F11_Kodak_250D_Cinema_AppleLog2.cube** for Apple Log 2 recording.

04 Enable the imported look

Back in LUTs Manager, turn on **Enable Imported LUTs** if the option appears. Check the switch beside your imported GuVue look. Repeat the import for any other looks you want from the same folder.

Control screenshots from the GuVue HK guide. The list count reflects that example.

Preview or record the look.

Blackmagic Camera / 3 of 3. Set up monitoring, then decide what to save in the clip.

Select a look on the Camera screen

Return to **Camera**, open the LUT controls, select your imported Film look, and turn on the display LUT.

PREVIEW ONLY

Keep the source color

In **Settings > LUTs**, leave **Record LUT to Clip** off. The monitor shows the look while the saved clip keeps its recording color space. Apply the matching LUT in your editor.

RECORD THE LOOK

Save the graded color

Turn **Record LUT to Clip** on to bake the selected look into new clips. Treat those clips as already graded and skip the same LUT when editing.

Set the output tag

If the imported LUT has a **Color Space Tag** setting in **LUTs Manager**, choose **Rec.709**. The tag describes the Film LUT output. The recording color space determines which file to import.

Control screenshot from the GuVue HK guide.

Record a short test

Play the saved file in your editor and verify its color before filming the full take. An Apple Log 2 clip will still need grading when you use preview only. A clip with baked color carries the look into the edit.

Blackmagic Camera / Official iOS settings reference

Install. Apply. Adjust.

DaVinci Resolve example. The six panels show the desktop editing workflow.

01

Unzip the download

Save the ZIP from your order download. Extract it first. A ZIP archive itself is not a LUT file.

02

Open the LUT folder

In Project Settings, open Color Management and find Lookup Tables. Choose Open LUT Folder.

03

Copy the matching files

Make a GuVue Film folder in that location. Copy the CUBE files for the input version you need.

04

Refresh the list

Return to Project Settings and select Update Lists. Your files can then appear in the LUT browser.

05

Apply to a clip node

On the Color page, select a clip and a node. Apply one matching GuVue file from the LUT browser or node LUT menu.

06

Check the result

Correct exposure and white balance, compare the image and adjust the look as needed. Export a short test and review it.

Menu labels vary by software version. Other editors or mobile apps must support importing CUBE LUTs. The phone's native camera app cannot import these files directly.

A quick check before you export.

Check the input format, the saved clip and the grade.

The image looks too contrasty or strangely colored.

Check the input version and whether the software applied an additional color-space conversion. Do not stack the Apple Log 2 and Rec.709 versions.

The LUT is missing from the list.

Check that the ZIP is extracted and the selected file ends in .cube. In Blackmagic Camera, check the switches in LUTs Manager. In Resolve, refresh the LUT list.

The saved clip still looks flat.

Check Record LUT to Clip in Blackmagic Camera. With the switch off, the LUT is for monitoring. Apply your matching Film LUT in post, or enable the recording switch for future clips.

The result is darker or warmer than expected.

Start with the source exposure and white balance. Check faces, key objects, highlights and shadow detail. A LUT is a starting point, not an automatic correction for every scene.

Will it add grain, glow or skin smoothing?

No. The files change color and tone. Grain, halation, sharpening and retouching require separate processing in your software.

NEED HELP?

Contact shop@guvue.me with your order number, software/app name, source recording format and a description of the issue. This is a digital download. Software and filming equipment are not included. Resale or redistribution for sale is prohibited.
